## < Previous

To replicate over a private connection, you need to set a subnet in the target location and connect that subnet to the source location via a private connection (usually a VPN or DirectConnect).

Then, you can choose to use that subnet for all the Replication Servers by changing the setting in the *Replication Settings* tab of the *Account* page in the CloudEndure console.

In the *Replication Settings* tab of the *Account* page, select the subnet you designated for the Replication Servers and check the *Use VPN* checkbox to initiate replication over a private connection.

Replication will start on the private network soon after you click the Save Replication Settings button.
