Check that all the target machines have been placed in the correct subnets and that the correct private IPs were assigned to them.

Also check that elastic IPs were attached to any relevant target machines (as defined during the 'Configure target machine blueprint' step).

If the target machines were created in the wrong subnet or if you'd like to change any of the other target machine properties, you may delete the target machine and go back to **step #6** to reconfigure the correct properties.
